

Although we had to correct the identified problems in the first 3 submissions, we have identified and rectified an additional error in the fourth submission related to the indexes we created.

Due to a misunderstanding within the group regarding the final attributes we used for each of the collections (some of which we used in a scrapped version but were removed/renamed), a few of the indexes we proposed referenced fields that didn't exist. Below we have listed the erroneous indexes and an explanation of the error/possible correction.

1. USERS:

- `db.users.createIndex({ username: 1 });`
Should have written 'nick' instead of 'username', following the current model's attribute name

2. SONGS:

- `db.songs.createIndex({ release_date: -1 });`
There doesn't exist such attribute as 'release-date' in the current schema.

3. PLAYLIST:

- `db.playlist.createIndex({ created_at: -1 });`
- `db.playlist.createIndex({ user_id: 1, created_at: -1 });`
The 'created_at' field once again doesn't exist.

4. FOLLOWS:

- `db.follows.createIndex({ followers: 1, followed_at: -1 });`
- `db.follows.createIndex({ following_users: 1, followed_at: -1 });`
The attribute 'followed_at' doesn't exist, by deleting that part the index would work fine

By making these changes/deletions the indexes would accurately reflect the correct schema, and would be optimized for certain query operations

\section*{Correction of Indexes in the Fourth Submission}
```

Although we had to correct the identified problems in the first 3 submissions, we have identified and rectified an additional error in the fourth submission related to the indexes we created.

Due to a misunderstanding within the group regarding the final attributes we used for each of the collections (some of which we used in a scrapped version but were removed/renamed), a few of the indexes we proposed referenced fields that didn't exist. Below we have listed the erroneous indexes and an explanation of the error/possible correction.

USERS:

```
db.users.createIndex(\{ username: 1 \}); \\\
```

Should have written 'nick' instead of 'username', following the current model's attribute name

SONGS:

```
db.songs.createIndex(\{ release\_date: -1 \}); \\\
```

There doesn't exist such attribute as 'release-date' in the current schema.

PLAYLIST:

```
db.playlist.createIndex(\{ created\_at: -1 \}); \\\
```

```
db.playlist.createIndex(\{ user\_id: 1, created\_at: -1 \}); \\\
```

The 'created_at' field once again doesn't exist.

FOLLOWS:

```
db.follows.createIndex(\{ followers: 1, followed\_at: -1 \}); \\\
```

```
db.follows.createIndex(\{ following\_users: 1, followed\_at: -1 \}); \\\
```

The attribute 'followed_at' doesn't exist, by deleting that part the index would work fine

By making these changes/deletions the indexes would accurately reflect the correct schema, and would be optimized for certain query operations.
